Steps for each pipeline

Model fitting with a dataset, number of steps is 3
1- Create data_loader with dataset_name="diabetes"
2- Create Logistic Regression model with C=0.5
3- Create Model Fitter which takes X_id, y_id, model_id

Build a Neural Network, number of steps is   4
1- Create Input Layer with shape=[4]
2- Create a Dense Layer takes prev_node_id of previous node (input layer)
3- Create another Dense Layer takes prev_node_id of previous node (Dense Layer)
4- Create a Sequential Model that takes layer_node_id for last layer
